

Valve insulation has never been easier!!

RuB is pleased to announce a new concept in valve thermal insulation.

Traditionally, installers insulate piping systems leaving mechanical components open for inspection. As a consequence, these devices, including shut-off valves, dispense heat to the atmosphere with consequent increase of heating costs. In other situations, installers do insulate components, but have to spend time to work insulation around them.

The NEW *RuB* OverCoat™ offers ease of installation, effective insulation and ease of removal. It fits most *RuB* ball valves with extended stems or with normal short stem. The valve remains fully operable and functional.
